

Natural Detective: A Gamified Tutorial on Natural Deduction in Propositional Logic

Project Proposal

Helena Josol [1]

1 Problem Description

Proposal will be similar to the dissertation intro. Write in future tense.

1. What will I do?

- To build an educational game that teaches introductory natural deduction in propositional logic.
- (a) Why is it meaningful / relevant?
- (b) Why is it interesting?
- (c) An outstanding problem
- (d) Aims: ... *identify, at a high level, what you hope to achieve*
- (e) Objectives: ... *quantitative and qualitative measures by which the completion of your project will be judged (How to know that my project is a success? Setting my own assessment criteria.)*
 - Objective 1: Design and build a system that does...
 - Objective 2: Evaluate its performance in terms of...
 - Objective 3: Present guidelines for future systems that do...

2. Why will I do it?

- Games are good for education and are very suitable to make mathematical concepts more accessible. Features:
 - Accessibility: games are easy to pick up (unlike, say, a textbook). One reason is that they can restrain the things you can do: they will not allow you to make "illegal" moves, and they can limit the available moves to those relevant to the problem. In contrast, with exercises in a textbook nobody tells you how to get started, and whether what you're doing makes sense.

- Engagement: similarly, games are hard to put down. That is because they're fun (at least, that's the intention). The consequence is that you can spend a long time learning something without even noticing.
- Instant feedback: a game will tell you immediately when your answer is wrong. Every theory of learning will tell you that that's very important, since the sequence of thoughts leading you to a wrong answer should still be fresh, if you want to find out where you went wrong. This is why tutorials are so good, compared to (most) lectures, and why good tutors are essential.

2 Scope & limitations

Why didn't you...? Why did you focus on...?

3 Requirements

Functional and non-functional requirements, specification (table)?

4 Design

How will I do it?: Have a rudimentary game idea already. Ask Willem for feedback and input.

4.1 Learning objective

What do you want the player to learn? (e.g. Learn to construct a finite automaton)

4.2 Player goals

e.g. Construct a finite automaton corresponding to a given regular expression

4.3 Player moves

e.g. Add states; add transitions; make final states; change transition labels; validate answer

4.4 Interface

The challenge is in making a good interface.

4.5 Feedback & rewards

4.6 Level design

Collaborate with Willem on this.

4.7 Platform

The resulting software will be an we application for reasons of easy access and convenience on the the part of the users, mainly that developing it as a web application eliminates the need for technical knowledge on the part of the users in order to build, install and setup the software, in addition to having to read and consult lengthy technical documentation, manuals and readmes.

This is another paragraph!

5 Project Management

5.1 Gantt Chart

5.2 Waypoints and Endpoints

6 Resources

Consider resources and their availability
